

MRI Arthrogram

Information for patients

What is this leaflet about?

This leaflet will provide you with information about a MRI Arthrogram.

What is a MRI Arthrogram?

A MRI arthrogram is a procedure to help diagnose an injury to a joint (usually the shoulder or hip). This is a two part procedure. During the first procedure (Arthrogram), a specialist MRI dye (called contrast) is injected into the joint. The second procedure involves having a MRI (magnetic resonance imaging scan) of the joint – please refer to the MRI leaflet.

Why do I need this?

The surgeon, physician or specialist physiotherapist who has referred you has decided that a MRI arthrogram is the best procedure to diagnose your symptoms. They will have discussed this with you before referring you.

If you are not sure this is the correct test for you, you should discuss this with your surgeon, physician or specialist physiotherapist.

Preparation

You do not need to stop eating or drinking before this procedure, you can continue to eat and drink as normal. You should wear loose fitting clothing. It is advisable to wear a top with straps i.e. vest top or similar.

Please remove metal objects (like earrings and piercings) for the MRI.

What happens when you arrive for your MRI Arthrogram?

When you arrive, please check in at the X-Ray reception desk; staff there will tell you where to sit. You will be called to the procedure room by a member of staff. Once in the room they will discuss the procedure with you. You will need to change into a theatre gown for the MRI. You may need to remove items of clothing at the area of injection for the arthrogram procedure.

The radiologist will ask for verbal consent for the procedure. A Radiographer or Radiology Department Assistant will go through a MRI checklist with you.

During the procedure - Arthrogram

The procedure will involve lying on the fluoroscopy table. You will be awake throughout the procedure.

The injections are performed using a sterile procedure. The radiologist carrying out the procedure will do an initial X-ray to help mark out the area to be injected. The skin is cleansed using an antiseptic solution or wipe. Local anaesthetic is injected to numb the skin, then using X-rays the needle is guided into position and the injection is performed. A liquid dye (called contrast), which shows up clearly on X-rays is injected to make sure the needle is in the correct place, a specialist MRI dye is then injected.

You will then be taken through to the MRI department.

How long will I be in hospital/clinic?

The arthrogram procedure takes about 20 to 30 minutes and the MRI procedure takes about 20 -30 minutes, you can go home immediately afterwards.

In some cases there may be a delay in taking you for your appointment, especially if staff are dealing with an emergency or unwell patient. If you have waited for more than 30 minutes after your appointment time, please inform the reception desk.

Immediate aftercare

You may find that the area injected feels numb or heavy. This is normal and is caused by the local anaesthetic. This takes between 1 and 4 hours to wear off. You may find that the joint makes 'funny' noises when moving it – this is normal and is caused by the fluid in the joint. This takes between 3 and 6 hours to wear off.

Going home

There are no special requirements for going home after this procedure. It is advised that you bring along someone to drive you home after the procedure, as we would advise that you do not drive or "operate heavy machinery" for at least 6 hours after the procedure.

Follow-up care

The results of this procedure will be sent to the surgeon, physician or specialist physiotherapist that referred you. Your GP will also be sent a copy of the results. If you have been asked by your referring surgeon, physician or specialist physiotherapist to keep a pain diary, it is important to complete it.

Many people see a positive result within a few days, but for others it can take several months to achieve the full benefit. It is also possible that the procedure may not improve your symptoms. If this happens, the surgeon, physician or specialist physiotherapist referring you will decide what to do next.

What are the risks of the procedure?

Some side effects (complications) are common to all injections

- Pain, discomfort, bleeding, bruising to injection site
- Joint infection – There is a very low risk of joint infection from this procedure. If your shoulder becomes swollen, painful and red, or you feel unwell and feverish, then you must seek medical attention immediately.
- Allergic reaction – Such as rash or itching.

If you are concerned about whether or not to proceed with the MRI Arthrogram, you should discuss this with the surgeon, physician or specialist physiotherapist who referred you.

Back to normal life

Following the procedure there are no restrictions to movements or activities.

You may have been given instructions by the surgeon, physician or specialist physiotherapist who referred you, please follow those.

Any more questions?

Please contact the surgeon, physician or specialist physiotherapist who referred you.

Cancellation

While we make every effort to avoid this where possible, there is always a risk that your injection may be cancelled at short notice. This is due to either emergency patients who need urgent treatment or other reasons which are beyond our control. We realise that this can cause distress and inconvenience but, in the event that your injection is postponed, you will be offered a new date as soon as possible.

Keeping your appointment

If you cannot keep your appointment, or have been given one that is unsuitable, please change it by phoning the number on your appointment letter. Your call will give someone else the chance to be seen and will help us keep waiting times to a minimum.

Public transport and travel information

Bus details are available from:

Lothian Buses on 0131 555 6363 or www.lothianbuses.co.uk

Traveline Scotland on 08712 002 233 or www.travelinescotland.com

Train details are available from:

National Rail Enquiries on 03457 484 950 or www.nationalrail.co.uk

Patient transport

Patient transport will only be made available if you have a medical or clinical need. Telephone 0300 123 1236 (calls charged at local rate) up to 28 days in advance to book, making sure you have your CHI Number available. A text relay service is available if you are hard of hearing or speech impaired. They can be contacted on: 18001-0300 123 1236 (calls charged at local rate). To cancel patient transport, you should telephone 0800 389 1333 (Freephone 24 hour answer service).

Interpretation and translation

Your GP will inform us of any interpreting requirements you have before you come to hospital and we will provide an appropriate interpreter. If you are having this procedure as an existing in-patient, staff will arrange interpreting support for you before your procedure. This leaflet may be made available in a larger print, Braille or your community language.

Supporting positive conversations

NHS Lothian supports person-centred care, and encourages patients to be involved in making decisions about their healthcare. It is important that you have a clear understanding of the care and treatment options available, and the risks and benefits specific to you, before you consent to treatment.

This leaflet contains general information about your care and treatment. If you have any further questions, you are encouraged to discuss these with the healthcare professional who is providing your care.

You may wish to ask:

- What are the benefits to me of receiving this treatment?
- What are the risks to me of receiving this treatment?
- Are there any alternative treatments which might be suitable for me?
- What might happen to me if I decide to do nothing?
