

Fluoroscopy uses x-rays to take pictures. The special camera can take a movie of the moving parts of your body to show the doctor how your insides are working.

You might need to have a special contrast liquid to help highlight the part of your body that is being examined. You may be asked to drink it.

The special contrast liquid is black on the x-ray image. Here, it shows how this boy swallows and how the contrast moves inside him to his stomach.

You need to sit or lie very still for the camera so that the pictures aren't blurry.

FACTS ABOUT FLUOROSCOPY

- Fluoroscopy uses x-rays to create "real-time" moving images of inside your body. It helps doctors see how your body functions.

- X-rays are a type of electromagnetic radiation. Their wavelength is smaller than UV rays and they are invisible to the human eye. You can not feel or see them.

- Fluoroscopy is also used in airport security scanners to check for hidden objects and in the early 20th century Fluoroscopy scanners were even commonly used to measure foot size for shoe-fitting in American shoe stores.

Fluoroscopy (Stomagram)

Information for parents and carers -

What is a Stomagram?

This is a special x-ray test that looks at the bowel, usually from stoma to rectum. The special x-ray dye shows up on the pictures and allows us to see clearly inside the body.

What will the test involve?

When you arrive you will be taken to the x-ray room, where you will meet the radiographer, nurse and radiologist. They will explain the test, and there will be an opportunity to ask any questions.

Your child will need to be undressed and in the case of older children, the department will provide a gown for them to wear. You will need to remove the stoma bag so that we can access the stoma.

The test involves the radiologist inserting a small, soft tube into the stoma, usually the non-functioning part. Then some liquid that will show up on x-ray will slowly be injected through the end of the tube into the bowel. X-ray pictures will then be taken with your child in different positions.

You will be asked to stay in the x-ray room with your child. If you are or may be pregnant you will not be able to stay in the room while the scan is being done. In this case another familiar adult should stay with your child. Other children will not be allowed in the scanning room so please make arrangements for them to be looked after at home.

How long will it take?

This test should not take more than 30 minutes

What happens afterwards?

At the end of the procedure you can replace your child's stoma bag and if appropriate your child can sit on the toilet to pass the fluid or in the case of babies, the nappy will be replaced and the liquid will pass naturally. You will then be free to leave the department.

What Preparation is required ?

Important information – Preparation required

There is no specific preparation.

However we will need to remove your child's stoma bag, so it would be useful if you could bring a change of bag with you.

What if my child is taking medication?

Do not stop taking any prescribed medications, as it will not affect your scan. Nor will the scan affect the usefulness of the drug. If you have any questions about this do not hesitate to contact the department.

How will I get the results of the test?

The result will be sent to the doctor who asked for this test, normally within 7-10 days. The doctor who has asked for the test will then send you a follow-up appointment to discuss your results with them. If this was your GP, please contact them directly after 7-10 days. The staff in the Imaging Department are unable to give results over the phone.

What if I do not speak English?

If you need help with the English language please phone **0131 312 0896** as soon as possible and we can arrange an interpreter for you.

How do I get to Fluoroscopy?

Fluoroscopy is in the Imaging Department on the ground floor. Book in for your appointment at the Imaging Department reception.
