

Stages of making a denture (false teeth)

There needs to be 2 weeks between each visit

- ☐ **First set** of impressions (moulds).
- ☐ **Second set** of impressions (moulds)
These are more accurate than the first set.
- ☐ **Measurements taken**
Blocks of wax are used to measure the correct size, shape and position of teeth and the way that the teeth bite together. The colour of the teeth is also chosen.
- ☐ **Trial stage**
The dentures are made in wax with the teeth on them so the size, shape and appearance of the teeth can be tried in the mouth and the way that the teeth bite together can be checked and changed if necessary.
Sometimes this stage needs to be repeated if changes are made.
- ☐ **Fit stage** – the dentures are fitted, and any adjustments are made.
